## Introduction to Quantum Computation, UPB Winter 2022, Assignment 3

To be completed by: Thursday, November 3

## 1 Exercises

- 1. (a) Let  $A \in \mathcal{L}(\mathbb{C}^d)$  be Hermitian. Prove that if for all  $|\psi\rangle \in \mathbb{C}^d$ ,  $\langle \psi | A | \psi \rangle \ge 0$ , then A has only non-negative eigenvalues. (Hint: Start by taking the spectral decomposition of A, and then make clever choices for  $|\psi\rangle$ .)
  - (b) Let  $A \in \mathcal{L}(\mathbb{C}^d)$  be Hermitian. Prove that if A has only non-negative eigenvalues, then for all  $|\psi\rangle \in \mathbb{C}^d$ ,  $\langle \psi | A | \psi \rangle \ge 0$ . (Hint: Write  $|\psi\rangle$  with respect to the eigenbasis of A.)
- 2. Let  $|\psi\rangle = |-\rangle \in \mathbb{C}^2$ . Suppose we measure in the Z basis  $B = \{|0\rangle\langle 0|, |1\rangle\langle 1|\}$ . What are the probabilities for each possible measurement outcome, and the corresponding post-measurement states?
- 3. Consider the teleportation protocol we saw in class. Does it still work if we replace the use of the entangled Bell state  $|\phi^+\rangle$  with the unentangled state  $|00\rangle$  (i.e. Alice and Bob share the state  $|00\rangle$ )? How about if we use  $\sqrt{2/5}|00\rangle + \sqrt{3/5}|11\rangle$  instead of  $|\phi^+\rangle$ ?
